

Savia bahamensis Maidenbush¹

Edward F. Gilman²

Introduction

Maidenbush is a small-leaved, compact, native shrub with some resemblance to cocoplum (Fig. 1). This 6- to 10-foot-tall euphorb has pretty, oval green leaves that are folded toward each other along the long stems. When the new growth of this plant emerges it is a bright red color. The fruits and flowers of the maidenbush are not the “stars of the show” but are small and inconspicuous; the foliage is the real attraction. This shrub makes a great specimen plant and is suitable for coastal landscapes.

communities. Soil pH in its native habitat is slightly alkaline or neutral.

Pests and Diseases

There are no major problems growing maidenbush.

Flower

Flower color: green

Flower characteristic: spring flowering

Fruit

Fruit shape: unknown

Fruit length: less than .5 inch

Fruit cover: dry or hard

Fruit color: brown

Fruit characteristic: inconspicuous and not showy

Trunk and Branches

Trunk/bark/branches: typically multi-trunked or clumping stems; not particularly showy

Current year stem/twig color: reddish

Current year stem/twig thickness: thin

Culture

Light requirement: plant grows in full sun

Soil tolerances: acidic; slightly alkaline; sand; loam; clay

Drought tolerance: high

Soil salt tolerances: unknown

Plant spacing: 36 to 60 inches

Other

Roots: usually not a problem

Winter interest: no special winter interest

Outstanding plant: not particularly outstanding

Invasive potential: not known to be invasive

Pest resistance: no serious pests are normally seen on the plant

Use and Management

Maidenbush will thrive on dry sandy soils in full or partial sun. Maidenbush is a drought-tolerant plant, but it may be damaged by cold weather in areas north of Vero Beach. Native soil is fairly well drained in the coastal upland plant
