**Prunus x yedoensis: Yoshino Cherry**¹
Edward F. Gilman and Dennis G. Watson²

---

**Introduction**

Yoshino Cherry grows quickly to 20 feet, has beautiful bark marked with prominent lenticels but is a relatively short-lived tree. It has upright to horizontal branching, making it ideal for planting along walks and over patios. The white to pink flowers which occur in early spring before the leaves develop are sometimes damaged by late frosts or very windy conditions. This is the tree along with ‘Kwanzan’ Cherry in Washington, DC, which makes such a show each spring.

---

**General Information**

- **Scientific name:** *Prunus x yedoensis*
- **Pronunciation:** PROO-nus x yed-oh-EN-sis
- **Common name(s):** Yoshino Cherry
- **Family:** Rosaceae
- **USDA hardiness zones:** 5B through 8A (Fig. 2)
- **Origin:** not native to North America
- **Invasive potential:** little invasive potential
- **Uses:** sidewalk cutout (tree pit); tree lawn 3-4 feet wide; tree lawn 4-6 feet wide; tree lawn > 6 ft wide; deck or patio; shade; specimen; Bonsai; highway median
- **Availability:** not native to North America

---

**Description**

- **Height:** 35 to 45 feet
- **Spread:** 30 to 40 feet
- **Crown uniformity:** symmetrical
- **Crown shape:** vase, round
- **Crown density:** moderate

---

2. Edward F. Gilman, professor, Environmental Horticulture Department; Dennis G. Watson, former associate professor, Agricultural Engineering Department, UF/IFAS Extension, Gainesville, FL 32611.
Prunus x yedoensis: Yoshino Cherry

**Growth rate:** moderate
**Texture:** medium

**Foliage**
- **Leaf arrangement:** alternate (Fig. 3)
- **Leaf type:** simple
- **Leaf margin:** double serrate, serrate
- **Leaf shape:** ovate, oblong, elliptic (oval)
- **Leaf venation:** pinnate, brachidodrome
- **Leaf type and persistence:** deciduous
- **Leaf blade length:** 2 to 4 inches
- **Leaf color:** green
- **Fall color:** yellow
- **Fall characteristic:** showy

*Figure 3. Foliage*

**Flower**
- **Flower color:** white/cream/gray, pink
- **Flower characteristics:** very showy

**Fruit**
- **Fruit shape:** round
- **Fruit length:** .5 to 1 inch
- **Fruit covering:** fleshy
- **Fruit color:** black
- **Fruit characteristics:** attracts birds; not showy; fruit/leaves not a litter problem

**Trunk and Branches**
- **Trunk/bark/branches:** branches droop; showy; typically one trunk; thorns
- **Pruning requirement:** needed for strong structure
- **Breakage:** resistant
- **Current year twig color:** brown
- **Current year twig thickness:** thin
- **Wood specific gravity:** unknown

**Culture**
- **Light requirement:** full sun
- **Soil tolerances:** clay; sand; loam; acidic; well-drained
- **Drought tolerance:** moderate
- **Aerosol salt tolerance:** none

**Other**
- **Roots:** not a problem
- **Winter interest:** yes
- **Outstanding tree:** yes
- **Ozone sensitivity:** unknown
- **Verticillium wilt susceptibility:** susceptible
- **Pest resistance:** sensitive to pests/diseases

**Use and Management**

Best used as a specimen or near the deck or patio for shade, Yoshino Cherry also works nicely along walks or near a water feature. Not a street or parking lot tree due to drought-sensitivity. Large specimens take on a weeping habit with delicate branchlets arranged on upright-spreading branches affixed to a short, stout trunk. A lovely addition to a sunny spot where a beautiful specimen is needed. Winter form, yellow fall color, and pretty bark make this a year round favorite.

Provide good drainage in an acidic soil for best growth. Crowns become one-sided unless they receive light from all around the plant, so locate in full sun. Select another tree to plant if soil is poorly drained but otherwise Yoshino Cherry adapts to clay or loam. Roots should be kept moist and should not be subjected to prolonged drought.

The cultivars are: `Akebona` (‘Daybreak’) - flowers softer pink; `Perpendens` - irregularly pendulous branches; `Shidare Yoshino` (‘Perpendens’) - irregularly pendulous branches.

**Pests**

Aphids cause distortion of new growth, deposits of honey-dew, and sooty mold.

Borers attack flowering cherries under stress. Keep trees healthy with regular fertilizer applications.

Scales of several types infest Prunus. Horticultural oil can be used to help control overwintering stages.

Spider mites cause yellowing or stippling but are very difficult to see. They are usually recognized only after plant symptoms are quite advanced.

Tent caterpillars make large webbed nests in trees then eat the foliage. One defoliation may not be serious and small nests can be pruned out and destroyed. Use *Bacillus thuringiensis* when the insects are first seen and are still small.
**Diseases**

A bacterium causes leaf spot and twig cankers on cherry. Small, reddish spots dry, and drop out, giving a shot-holed appearance. Defoliation can be severe when conditions favor disease development. Fertilize infected trees and prune out infected branches.

A fungus causes reddish spots which drop out leaving shot holes. Once the hole appear the leaves may drop. The disease is worse in wet weather.

Black knot causes black swellings or galls on the branches. Branches with galls are pruned out.

Powdery mildew causes a white coating on the leaves.

Yoshino Cherry may be subject to witches broom. Branches are deformed and clusters of small branches form. Infected branches bloom and leaf out earlier. Brooms are pruned out, to help control the disease.
