**Tilia cordata** ‘June Bride’: ‘June Bride’ Littleleaf Linden

Edward F. Gilman and Dennis G. Watson

### Introduction

‘June Bride’ littleleaf linden grows 30 to 45 feet tall and can spread 25 to 30 feet. This tree has a slower growth rate than other lindens but has a dense pyramidal to oval crown which casts deep shade. The glossy green leaves appear to be smaller than the species. This cultivar reportedly blooms and fruits more densely than the species, the small, fragrant flowers appearing in late June and into July. Many bees are attracted to the flowers, and the dried flowers persist on the tree for some time. Japanese beetles often skeletonize linden foliage, in certain areas in the northern part of its range. Defoliation can be nearly total and mature trees can be killed by severe infestations. Planting linden in areas with severe infestations of this pest may not be wise. However, at least one reference reports that defoliation by Japanese beetles is common but control is seldom needed.

### General Information

**Scientific name:** *Tilia cordata*

**Pronunciation:** TILL-ee-uh kor-DAY-tuh

**Common name(s):** ‘June Bride’ littleleaf linden

**Family:** Tiliaceae

**USDA hardiness zones:** 3A through 7A (Fig. 2)

**Origin:** not native to North America

**Invasive potential:** little invasive potential

**Uses:** hedge; urban tolerant; container or planter; street without sidewalk; screen; shade; specimen; parking lot island 100–200 sq ft; parking lot island > 200 sq ft; sidewalk cutout (tree pit); tree lawn 3–4 feet wide; tree lawn 4-6 feet wide; tree lawn > 6 ft wide; highway median

**Availability:** not native to North America

### Description

**Height:** 20 to 30 feet

**Spread:** 15 to 25 feet

**Crown uniformity:** symmetrical

**Crown shape:** pyramidal, oval

**Crown density:** dense

**Growth rate:** slow

**Texture:** medium
**Foliage**

*Leaf arrangement:* alternate (Fig. 3)

*Leaf type:* simple

*Leaf margin:* serrate

*Leaf shape:* orbiculate, cordate

*Leaf venation:* pinnate

*Leaf type and persistence:* deciduous

*Leaf blade length:* 2 to 4 inches

*Leaf color:* green

*Fall color:* yellow

*Fall characteristic:* not showy

**Flower**

*Flower color:* yellow

*Flower characteristics:* showy

**Fruit**

*Fruit shape:* round

*Fruit length:* less than .5 inch

*Fruit covering:* dry or hard

*Fruit color:* brown, tan

*Fruit characteristics:* does not attract wildlife; showy; fruit/leaves not a litter problem

**Trunk and Branches**

*Trunk/bark/branches:* branches droop; not showy; typically one trunk; thorns

*Pruning requirement:* little required

*Breakage:* resistant

*Current year twig color:* brown, green

*Current year twig thickness:* thin

*Wood specific gravity:* unknown

**Culture**

*Light requirement:* full sun, partial sun, or partial shade

*Soil tolerances:* sand; loam; clay; acidic; alkaline; well-drained; occasionally wet

*Drought tolerance:* moderate

*Aerosol salt tolerance:* none

**Other**

*Roots:* not a problem

*Winter interest:* no

*Outstanding tree:* yes

*Ozone sensitivity:* unknown

*Verticillium wilt susceptibility:* susceptible

*Pest resistance:* resistant to pests/diseases

**Use and Management**

Small lateral branches arise from the single, straight trunk in a nearly horizontal fashion. Multiple trunks and upright, large-diameter branches occasionally develop on the species and they may be poorly attached to the trunk, but this does not appear to happen on this cultivar. Be sure to purchase and train linden to one central trunk with well-spaced, small-diameter lateral branches. The cultivars ‘Greenspire’ ‘June Bride’ and ‘Glenleven’ have been developed for their very straight trunk. Linden may sprout from the base and these will have to be removed from time to time.

The tree grows in sun or partial shade, will tolerate alkaline soil if it is moist, and it transplants well. It is not particularly tolerant of drought, scorching at the leaf margins in summer drought. But this apparently does little long-term harm. It is more tolerant of heat and compact soil than American basswood. Many communities plant linden along the streets due to its rapid growth rate and dense, symmetrical crown but littleleaf linden is sensitive to road salt. There are a number of cultivars with a variety of habits.

The wood of linden is clear white, soft and often used for drawer sides in inexpensive furniture. Though not as soft as balsa wood, it sands poorly and is difficult to finish.
There are several other cultivars: ‘Chancellor’—upright when young but becoming pyramidal, fast growth, with a straight, single trunk; ‘Glenleven’—conical (pyramidal), fast growth, straight trunk, more open canopy than species; ‘Greenspire’—straight trunk and radially produced branches—may be the least-maintenance cultivar; ‘Pyramidalis’—widely pyramidal; ‘Rancho’—narrow, upright growth habit, very small, fine textured leaf—a beautiful tree; ‘Sterling’ is supposed to resist Japanese beetles.

**Pests**

Despite susceptibility to various insects and diseases, control is usually not needed except for Japanese beetle.

Japanese beetles often skeletonize linden foliage, in certain areas in the northern part of its range. Defoliation can be nearly total and mature trees can be killed by severe infestations. Planting linden in areas with severe infestations of this pest is not recommended.

Aphids can be a problem on Linden causing the production of honeydew. This is more of a nuisance than a life threatening problem.

Several caterpillars feed on linden. Have the insect identified then apply the appropriate control, if needed. *Bacillus thuringiensis* will not be effective against sawfly larvae. Fall webworm nests can be pruned out when still small.

Lace bugs cause discoloration of the leaves. The insects are found on the undersides of the leaves and can cause some early defoliation but are otherwise harmless.

Spider mites cause leaves to become stippled and yellowed. The mites are usually not discovered until there is a significant infestation.

**Diseases**

No diseases are usually serious.

Anthracnose causes elongated light brown areas next to the veins. The spots may be anywhere on the leaf but are most often near the tip. The spots are bordered by a distinct black band. Severe infections defoliate the tree. The disease does not require chemical controls every year but repeated severe infections may justify spraying.

Leaf blight causes leaves to brown and fall. The early symptoms are round, brown spots with dark borders. The spots become numerous leading to leaf browning and drop.

Several fungi cause cankers and dieback on branches and trunks. Remove infected branches as they occur and avoid wounding the tree. Fertilizing infected trees may help.

Powdery mildew forms a white coating on the leaves but is usually not serious and does not require treatment.

*Verticillium* wilt causes dieback and death of individual branches or the entire tree. Keep trees healthy with a regular fertilizer program to help prevent the disease.
